Digital Platforms plan

Month by month, your platform goes from idea to production: first we design it and test it with your users, then we build the core, integrate it with your systems and deploy it in your cloud.

2 to 4 months
from idea to production

5 deliverables
the code and the data are yours

20-min call
to start, with no sales commitment

AT THE END YOU HAVE IN PRODUCTION

1. **A platform tested with users**
   Product strategy and validated flows
2. **A design that grows with you**
   Interface and Design System to add without rebuilding
3. **An architecture ready for AI**
   Web and mobile on decoupled APIs in your cloud
4. **A measured operation**
   Automated tests, monitoring and a 99.9% SLA

A 2-TO-4-MONTH PLAN

The process and what you take away at each step

1 MONTH 1

Strategy and design

We define the architecture with you, prototype and validate the key flows with real users before writing code.

✓ YOU TAKE AWAY

Validated prototype · Technical architecture

2 MONTH 2

Core

We build the database, the APIs, secure access and the main screens, on the architecture we defined with you.

✓ YOU TAKE AWAY

Main modules in testing

3 MONTH 3

Integrations

We connect payments, ERP or CRM, automate the tests and review security against the OWASP Top 10.

✓ YOU TAKE AWAY

Automated tests · OWASP review

4 MONTH 4

Production

We deploy in your cloud with monitoring and telemetry from day one, so you know how your platform is used.

✓ YOU TAKE AWAY

Platform in production

MONTH 1 | MONTH 2 | MONTH 3 | MONTH 4

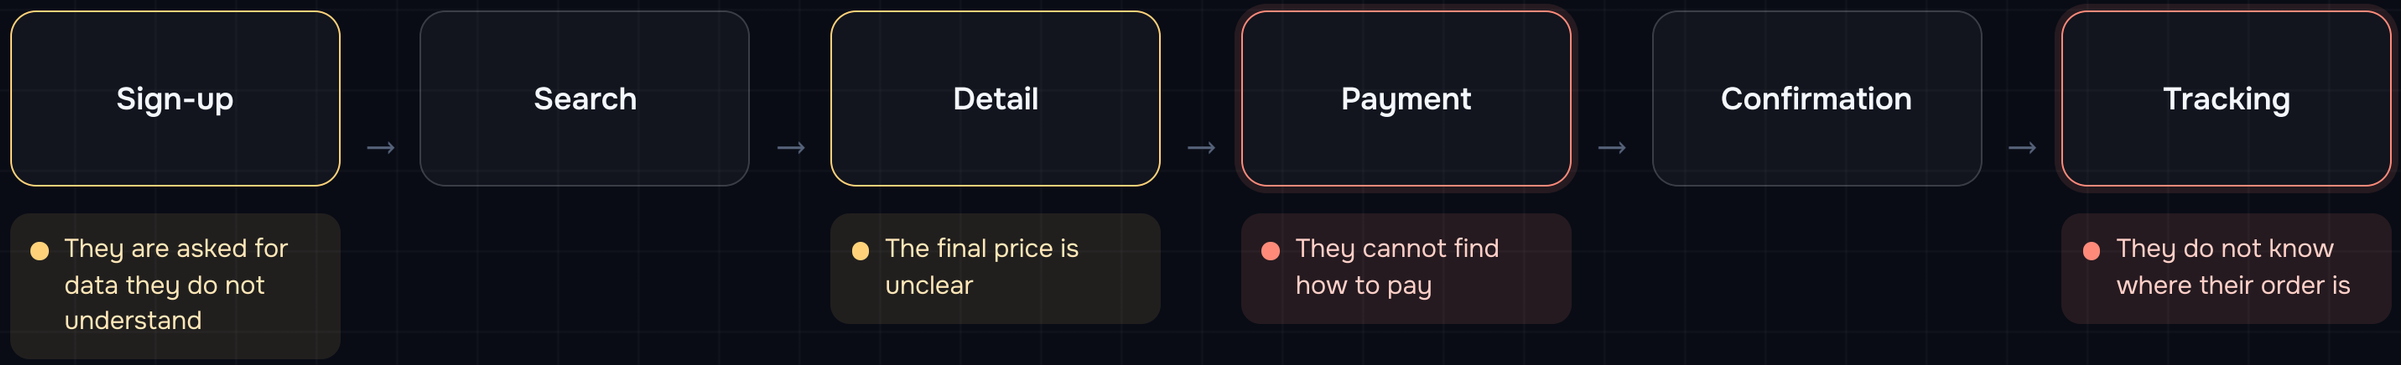

2 to 4 months

This is what a 4-month platform looks like. A focused MVP can ship in 2; the exact plan is set when we agree on it.

ILLUSTRATIVE EXAMPLE VALIDATED PROTOTYPE

What gets fixed before writing code

Real users walk through the prototype and we mark every point where they get stuck. Fixing it here costs a design change, not a rewrite.

Each stage

Is a screen of the key flow, tested with real users.

Each mark

Is a point where the user stops, makes a mistake or drops off.

The color

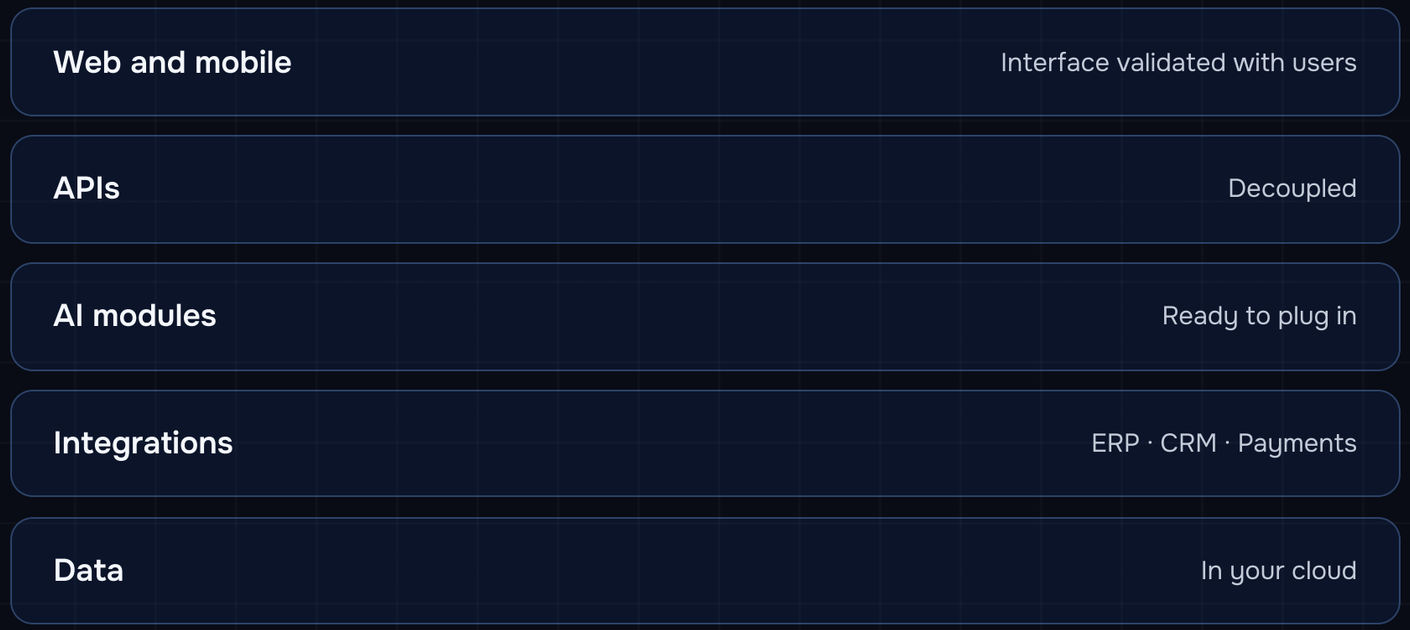

Says what gets fixed first, before a single line of code is written.

A generic flow to show the format. Yours comes from your real users.

ILLUSTRATIVE EXAMPLE TECHNICAL ARCHITECTURE

A platform that grows without being rebuilt

Each layer can change without touching the others: adding an AI module or a new system does not force a rebuild.

ON EVERY CHANGE

- Automated tests before reaching production.
- Security review against the OWASP Top 10.
- Monitoring and telemetry from day one.
- Deployment in your cloud with a 99.9% SLA.

A reference architecture to show the format. Yours depends on your product and your systems.

ILLUSTRATIVE EXAMPLE PRODUCT STRATEGY

What goes into the MVP and what waits

Each module is ranked by the value it gives the user against the effort to build it, to reach production on time.

MODULE	VALUE FOR THE USER	EFFORT	WHEN
Sign-up and secure access	●●●	●○○	MVP
Catalog and search	●●●	●●○	MVP
Online payment	●●●	●●○	MVP
Admin panel	●●○	●●○	Phase 2
Notifications	●●○	●○○	Phase 2
AI recommendations	●●○	●●●	Later

MVP
The minimum for your users to complete their main task from day one.

Phase 2
What improves the operation once the platform is in use.

Later
What adds value and is decided with real usage data.

Generic modules to show the format. Yours come from the product strategy.

AT THE END

Keep evolving

With the platform in production, a Digital Evolution squad (Service 04) measures it and improves it every sprint. Your own team can also take it over.

The code and the data are yours

The platform lives in your cloud, with automated tests and documentation so any team can maintain it.

WHAT WE NEED FROM YOUR TEAM

- Someone who makes the product decisions.
- Access to real users to test the prototypes.
- Access to the systems to be integrated (ERP, CRM, payments).

How we start

Book a 20-minute call, with no sales commitment, with someone from the technical team. We review your idea and tell you what can ship in the first MVP.
